

ECEN 215, Spring 2024

Electrical Circuit Theory

Lecture 8: Resistive Circuits Revision

Ramy Rady

Dept. of Electrical and Computer Engineering

Texas A&M University

ramyrady@tamu.edu

Assignments

- Exam #1 covering chapter 1, 2 will be this Wednesday (Feb 21) in classroom, 9:10 to 10:00
- Please study all notes and assignments
- I will provide a cheat sheet

Example

- For the circuit shown:
 - Find the voltage V ,
 - Find the power delivered to the circuit by the current source,
 - Find the power dissipated in the 10Ω resistor.

Example

Example 2

- Use the node-voltage method to find V in the circuit.

Example 2

Example 3

- Use the mesh-current method to find the power dissipated in the 2Ω resistor.

Example 3

Example 4

- Solve for voltage V

Example 5

- Find the Thevenin and Norton equivalent circuits with respect to the terminals a-b.

Example 5—solution

Example 6

- Find the Thevenin equivalent with respect to the terminals a-b.

Example 6—solution

Example 7

- Find V_x by applying a sequence of source transformations.

- Note:** If the circuit has dependent sources, we need to make sure to preserve the element with the control voltage/current.

Example 8

- (a) Find R_L that maximizes power transfer to the load.
(b) What is the maximum power transferred to the load?

Example 8, cont.

- (a) Find R_L that maximizes power transfer to the load.
(b) What is the maximum power transferred to the load?

Open Circuit Voltage

Example 8, cont.

- (a) Find R_L that maximizes power transfer to the load.
 (b) What is the maximum power transferred to the load?

Example 8, cont.

- (a) Find R_L that maximizes power transfer to the load.
 (b) What is the maximum power transferred to the load?

Alternatively (Method 3)
 Disable Independent Sources
 and Apply Test Source
